

**LOCATION:** Galapagos Islands

### DID YOU KNOW?

The Galapagos Islands are the only place in the Northern Hemisphere where you can see penguins in their natural habitat. The Galapagos penguin is the second smallest species of its kind, and is the only penguin species to live near the equator. They are about 19.2 inches tall. They are fast swimmers and can swim up to 15 miles per hour underwater, which is why Miles loves this penguin - it's a fast animal! How long is the equator in miles?

I love things that are fast - especially planes, cars, and animals!

### GALAPAGOS MATH:

### OTHER FUN FACTS:

- There is an average of 12 hours of sunlight each day.
- 97% of the islands is a National Park.
- The Galapagos Islands are made up of about 19 islands.
- They have more than 400 species of fish.
